COMPOSITION
LORBREXEN 100 Tablet: Each film-coated tablet contains Lorlatinib INN 100 mg.

INDICATIONS
Lorlatinib as monotherapy is indicated for the treatment of adult patients with anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer (NSCLC) whose disease has progressed after:
- Alectinib or Ceritinib as the first ALK inhibitor therapy; or
- Crizotinib and at least one other ALK inhibitor.

DOSEAGE & ADMINISTRATION
The recommended dose is 100 mg Lorlatinib taken orally once daily.

Duration of treatment
Treatment with Lorlatinib is recommended as long as the patient is deriving clinical benefit from therapy without unacceptable toxicity.

Delayed or missed doses
If a dose of Lorlatinib is missed, then it should be taken as soon as the patient remembers unless it is less than 4 hours before the next dose, in which case the patient should not take the missed dose. Patients should not take 2 doses at the same time to make up for a missed dose.

Dose modifications
Dosing interruption or dose reduction may be required based on individual safety and tolerability. Lorlatinib dose reduction levels are summarized below:
- First dose reduction: 75 mg taken orally once daily.
- Second dose reduction: 50 mg taken orally once daily.

Lorlatinib should be permanently discontinued if the patient is unable to tolerate the 50 mg dose taken orally once daily.

Special Populations
Elderly (> 65 years)
Due to the limited data on this population, no dose recommendation can be made for patients aged 65 years and older.

Renal impairment
No dose adjustment is needed for patients with normal renal function and mild or moderate (CLcr: ≥ 30 mL/min) renal impairment based on a population pharmacokinetic analysis. Information for Lorlatinib use in patients with severe (CLcr: < 30 mL/min) renal impairment is very limited. Therefore, Lorlatinib is not recommended in patients with severe renal impairment.

Hepatic impairment
No dose adjustments is recommended for patients with mild hepatic impairment. No information is available for Lorlatinib in patients with moderate or severe hepatic impairment. Therefore, Lorlatinib is not recommended in patients with moderate to severe hepatic impairment.

Paediatric population
The safety and efficacy of Lorlatinib in paediatric patients below 18 years have not been established. No data are available.

CONTRAINDICATIONS
- Hypersensitivity to Lorlatinib
- Concomitant use of strong CYP3A4/5 inducers

WARNINGS AND PRECAUTIONS
Hyperlipidaemia
The use of Lorlatinib has been associated with increases in serum cholesterol and triglycerides. Median time of occurrence of severe increase in serum cholesterol and triglycerides is 201 days (range: 42 to 518 days) and 127 days (range: 15 to 358 days), respectively. Serum cholesterol and triglycerides should be monitored before initiation of Lorlatinib; 2, 4 and 8 weeks after initiating Lorlatinib, and regularly thereafter. Initiate or increase the dose of lipid-lowering medicinal products, if indicated.

Central nervous system effects
Central nervous system (CNS) effects have been observed in patients receiving Lorlatinib, including changes in cognitive function, mood or speech. Dose modification or discontinuation may be required for those patients who develop CNS effects.

Atrialventricular block
Lorlatinib was studied in a population of patients that excluded those with second-degree or third-degree AV block (unless paced) or any AV block with PR interval > 220 msec. PR interval prolongation and AV block have been reported in patients receiving Lorlatinib. Monitor electrocardiogram (ECG) prior to initiating Lorlatinib and monthly thereafter, particularly in patients with predisposing conditions to the occurrence of clinically significant cardiac events. Dose modification may be required for those patients who develop AV block.

Left ventricular ejection fraction decrease
Left ventricular ejection fraction (LVEF) decrease has been reported in patients receiving Lorlatinib who had baseline and at least one follow-up LVEF assessment. Based on the available clinical study data, it is not possible to determine a causal relationship between effects on changes in cardiac contractility and Lorlatinib. In patients with cardiac risk factors and those with conditions that can affect LVEF, cardiac monitoring, including LVEF assessment at baseline and during treatment, should be considered. In patients who develop relevant cardiac signs/symptoms during treatment, cardiac monitoring, including LVEF assessment, should be considered.

Lipase and amylase increase
Elevations of lipase and/or amylase have occurred in patients receiving Lorlatinib. Median time of occurrence of increase in serum lipase and amylase is 70 days (range: 7 to 696 days) and 41 days (range: 7 to 489 days), respectively. Risk of pancreatitis should be considered in patients receiving Lorlatinib due to concomitant hyperlipidaemia and/or a potential intrinsic mechanism. Patients should be monitored for lipase and amylase elevations prior to the start of Lorlatinib treatment and regularly thereafter as clinically indicated.

Intestinal lung disease/Pneumonitis
Severe or life-threatening pulmonary adverse reactions consistent with ILD/pneumonitis have occurred with Lorlatinib. Any patient who presents with worsening of respiratory symptoms indicative of ILD/pneumonitis (e.g. dyspnoea, cough and fever) should be promptly evaluated for ILD/pneumonitis. Lorlatinib should be withheld and/or permanently discontinued based on severity.

Drug-drug interactions
In a study conducted in healthy volunteers, the concomitant use of Lorlatinib and rifampin, a strong CYP3A4/5 inducer, was associated with increases of alanine aminotransferase (ALT) and aspartate aminotransferase (AST) with no increase of total bilirubin and alkaline phosphatase. Concomitant use of a strong CYP3A4/5 inducer is contraindicated.

Concomitant use with moderate CYP3A4/5 inducers should be avoided, if possible, as they may also reduce Lorlatinib plasma concentrations.

Concurrent administration of Lorlatinib with CYP3A4/5 substrates with narrow therapeutic indices, including but not limited to antifungal, ciclosporin, dihydroergotamine, ergotamine, fentanyl, hormonal contraceptives, midazolam, quinidine, sirolimus and tacrolimus, should be avoided since the concentration of these medicinal products may be reduced by Lorlatinib.

Fertility and pregnancy
During treatment with Lorlatinib and for at least 14 weeks after the final dose, male patients with female partners of childbearing potential must use effective contraception, including a condom, and male patients with pregnant partners must use condoms. Male fertility may be compromised during treatment with Lorlatinib. Men should seek advice on effective fertility preservation before treatment.

Women of childbearing potential should be advised to avoid becoming pregnant while receiving Lorlatinib. A highly effective non-hormonal method of contraception is required for female patients during treatment with Lorlatinib, because Lorlatinib can render hormonal contraceptives ineffective. If a hormonal method of contraception is unavoidable, then a condom must be used in combination with the hormonal method. Effective contraception must be continued for at least 35 days after completing therapy. It is not known whether Lorlatinib affects female fertility.

Dietary sodium
This medicinal product contains less than 1 mmol sodium (23 mg) per 25 mg or 100 mg tablet. Patients on low sodium diets should be informed that this product is essentially “sodium-free”.

Pharmacokinetic interactions
In vitro data indicate that Lorlatinib is primarily metabolized by CYP3A4 and uridine diphosphate-glucuronosyltransferase (UGT)1A1, with minor contributions from CYP2C8, CYP2C19, CYP3A5 and UGT1A3.

In vitro data indicate that Lorlatinib is primarily metabolized by CYP3A4 and uridine diphosphate-glucuronosyltransferase (UGT)1A1, with minor contributions from CYP2C8, CYP2C19, CYP3A5 and UGT1A3.
Lorlatinib 150 mg orally once daily for 15 days decreased AUC and terted alone, suggesting that Lorlatinib is an inducer of CYP3A4/5. In decreased oral midazolam AUC when midazolam was adminis-

**DRUG INTERACTIONS**

CYP3A4/5 inhibitors

Itraconazole, a strong inhibitor of CYP3A4/5, administered at oral doses of 200 mg once daily for 5 days, increased the mean Lorlatinib AUC by 42% and Cmax by 24% of a single 100 mg oral dose of Lorlatinib in healthy volunteers. Concomitant administration of Lorlatinib with strong CYP3A4/5 inhibitors (e.g. boceprevir,

cobicistat, itraconazole, ketoconazole, posaconazole, troleandomycin, voriconazole, ritonavir, paritaprevir in combination with ritonavir and ombitasvir and/or dasabuvir, and ritonavir in combination with either elvitegravir, indinavir, lopinavir or ritonavir) may increase Lorlatinib plasma concentrations. Grapefruit products may also increase Lorlatinib plasma concentrations and should be avoided. An alternative concomitant medicinal product with less potential to inhibit CYP3A4/5 should be considered. If a strong CYP3A4/5 inhibitor must be concomitantly administered, a dose reduction of Lorlatinib is recommended.

SIDE EFFECTS

The most frequently reported adverse reactions were hypercholes-
terolaemia (84.4%), hyperglyceridaemia (67.1%), oedema (54.6%), peripheral neuropathy (47.8%), cognitive effects (28.8%), fatigue (28.1%), weight increased (26.4%) and mood effects (22.7%). Dose reductions due to adverse reactions occurred in 23.4% of patients receiving Lorlatinib. The most common adverse reactions that led to dose reductions were oedema and peripheral neuropathy. Permanent treatment discontinuation associated with adverse reactions occurred in 3.1% of patients receiving Lorlatinib. The most frequent adverse reaction that led to permanent discontinuations was cognitive effects.

**OVERDOSE**

Treatment of overdose with the medicinal product consists of general supportive measures. Given the dose-dependent effect on PR interval, ECG monitoring is recommended. There is no antidote for Lorlatinib.

**PHARMACEUTICAL INFORMATION**

**How Supplied**

LORBREXEN 100 Tablet:
Each HDPE container of LORBREXEN 100 contains 30 film-coated tablets (each tablet contains 100 mg Lorlatinib) a silica gel desiccant and plastic foil with a child-resistant closure.

**Storage**

Store below 30°C. Protect from moisture and light.

Keep LORBREXEN out of the sight and reach of children.
